Preface ................................................................................................................... viii
Foreword ................................................................................................................ viii
Reader’s Overview ................................................................................................. ix

## CHAPTER 1: Africa

**Introduction** ........................................................................................................ 1

1.1: Africa’s Geography .......................................................................................... 2

- The Land ............................................................................................................. 2
- Soils ....................................................................................................................... 3
- Deserts .................................................................................................................. 3
- Mountains ........................................................................................................... 4
- The Great Rift Valley ............................................................................................ 5

1.2: Africa’s Changing Environment ........................................................................ 6

- Natural Change and Population ......................................................................... 6
- Changing Population ............................................................................................ 6
- Urban Population ................................................................................................. 7
- Coastal Population .............................................................................................. 7
- Air and Atmosphere ............................................................................................ 7

1.3: Earth Observations ......................................................................................... 13

- More People, More Trees: Success Story in Niger .............................................. 13
- Land Conversion ................................................................................................ 14
- Deforestation ...................................................................................................... 14
- Changes in Land Productivity ........................................................................... 16
- Land Degradation ............................................................................................... 16
- Desertification ..................................................................................................... 17

1.4: Water Sources and Use .................................................................................. 20

- Freshwater Fish .................................................................................................. 20
- Wetlands ................................................................................................................. 20
- Coastal and Marine Environments ..................................................................... 20

1.5: Biodiversity ..................................................................................................... 22

- 8 Biological Hotspots of Africa ............................................................................ 22
- A Few African Animals Extinct in the Wild ......................................................... 23

1.6: People .............................................................................................................. 34

- Crater Highlands, United Republic of Tanzania .................................................. 34
- Global Sea Surface Temperature ....................................................................... 34
- Global Phytoplankton Distribution .................................................................... 34
- Smart Sensing of Volcanoes ............................................................................. 34

References ............................................................................................................. 35
CHAPTER 2: Transboundary Environmental Issues

2.1: Transboundary Ecosystems and Protected Areas

- Across Country Borders.................................................................39
- Transboundary Ecosystems...............................................................41
  - The Congo Basin Forests.................................................................42
  - Masai Mara – Serengeti Protected Areas in East Africa.................43
  - Western Arly-Pendjari Parks Complex...........................................45
  - The Great Limpopo Transfrontier Park.........................................45
  - Mountain Gorilla Conservation in the Virunga Heartland..............46
  - Southern Sudan: A Survival Surprise.........................................46
- Ecosystems and Protected Areas.......................................................41

2.2: Transboundary Water Resources

- Transboundary River Basins.........................................................47
  - Lake Victoria: Africa’s Largest Freshwater Lake.........................48
  - Historical water level elevations of Lake Victoria......................48
  - High population growth rate around Lake Victoria....................48
  - Lake Victoria’s Winam Gulf..........................................................49
  - Water Hyacinth in Lake Victoria, 1995-2001...............................50
  - Lake Chad: Africa’s Shrinking Lake.............................................52
  - Declining Water Levels in Lake Chad, 1972-2007.......................53
  - Okavango: The World’s Largest Inland Delta.............................56

2.3: Transboundary Movement of People

- Conflicts and Refugees.................................................................57
  - Dadaab Refugee Camp.................................................................58
  - The Parrot’s Beak Region.............................................................59
  - Darfur Conflict..............................................................................60

2.4: Transboundary Movement of Pollutants

- Dust Storms and Fires..................................................................61
  - Dust storms..................................................................................62
  - Dust Storm in the Bodde Depression.............................................62
  - Aerosols.........................................................................................63
  - Smoke Spreading From Greece to Africa.....................................63
  - Fires...............................................................................................64
  - Biomass Burning in Africa.........................................................64
  - Seasonal Pattern of Wildland Fires..............................................65
  - Carbon Monoxide Pollution: A Result of Biomass Burning........66
  - Widespread Fires Release High Levels of CO.............................66
  - Southern Africa: Hotspot for Nitrogen Dioxide (NO₂)...................67

2.5: Conclusion..................................................................................67

References......................................................................................68

CHAPTER 3: Tracking Progress Towards Environmental Sustainability

3.1 United Nations Millennium Development Goals—The Millennium Declaration..........................................................73

3.2 Country Profiles and Images of Our Changing Environment.................................................................................76

Epilogue............................................................................................354

References......................................................................................355

Acronyms and Abbreviations.............................................................368

Annex I: Changes in MDG Goal 7: Environmental Sustainability Indicators.................................................................369

About Remote Sensing Images and Aerial Photographs Used in This Publication.................................................................370

Index................................................................................................371

Acknowledgements........................................................................373
Africa is the second-largest continent on Earth after Asia and currently considered among the most strategic regions in terms of global development opportunities. With about 30 million square kilometres including adjacent islands and the Sahara, the world’s largest desert, Africa covers over 20 per cent of Earth’s total land area. Africa is also the second most populous continent after Asia. With over 965 million people it accounts for about one-seventh of the world’s human population. The vast landscape of Africa contains a host of natural wonders and rich resources such as coltan and platinum, which are currently considered the most strategic minerals.

Its grasslands, wetlands, mountains, deserts, rainforests and marine areas are home to thousands of species of plants and animals. It is also a land of unparalleled natural beauty and its rainforests are an important storehouse of carbon. Its vast mineral and natural resources provide immense opportunities for economic growth, development and human well-being. The high economic growth of over 4.6 per cent witnessed in the region since 2004 is largely underpinned by the region’s environmental resources—oil exploration, improved agricultural performance, and tourism.

Africa is also a land of increasing population and rapidly changing land-use patterns—changes that have profound local, regional and global environmental significance. Sustaining a reasonably high economic growth rate to match the human population growth rate coupled with ensuring the environmental and natural resources integrity is one of the key challenges being addressed by the New Partnership for Africa’s Development (NEPAD) through its action plan on the environment (Action Plan). The African Ministerial Conference on the Environment (AMCEN) which is the apex body on the environment is responsible for, inter alia, guiding regional institutions and member states in implementing the Action Plan. It is also responsible for creating an enabling environment for cooperation in cross-border natural resources management and sharing best practices among the countries.

To achieve this in a region which is undergoing rapid changes in its economic development and ecosystems, demands for a dynamic and credible information base. AMCEN is, therefore, very proud to launch the Africa Atlas of Our Changing Environment, which is an evidence-based complementary publication of our flagship publication, the Africa Environment Outlook (AEO). The AEO report series continue to provide significant input to the AMCEN agenda and inform policy both at the regional and national levels.

AMCEN is indeed pleased to note that with the support of UNEP, all African countries were given opportunity to participate in production of the Atlas by identifying sites for analysis and reviewing the brief country profiles. As we reflect on each country’s progress towards achieving the Millennium Development Goal (MDG) 7 as presented in this Atlas, let us renew our political commitment to accelerate our efforts and ensure Africa’s path to sustainable development.

I would like to congratulate all the experts, AEO collaborating centres and development partners whose contribution has made this landmark publication possible. It is my sincere hope that what is documented in this report will inspire every reader into action. I wish you an enjoyable reading.

S.E. Monsieur André Okombi Salissa
President of the African Ministerial Conference on the Environment
Minister of Tourism and Environment of Congo
Africa is made up of a stunning mosaic of forests and woodlands, mountains, deserts, coastal lands and freshwater ecosystems upon which hundreds of millions of people depend. However, environmental change threatens the people and natural resources of this vast continent.

Africa: Atlas of Our Changing Environment provides compelling evidence of the extent and severity of such dramatic change over the past 30 years on the region’s environment due to both natural processes and human activities. The Atlas is the first major publication to depict environmental change in all of Africa’s countries using satellite imagery. By telling a vivid, visual story of the dramatic impacts on the continent’s landscapes, the Atlas is a resource for remedial action at local, national, and regional levels.

One of the Atlas’s most striking features is its site-specific, side-by-side display of historical and current remote-sensing imagery. “Before and after” satellite images show different kinds of environmental change: forest conversions and the loss or degradation of habitats; urban growth; altered hydrology (dams, shrinking lakes, river diversions, and drained wetlands); degraded coastal areas; mining developments; dryland modification; and the impacts of climate change. While it’s generally a challenge to present visually the impacts of climate change and land degradation in Africa due to the often long intervals between cause-and-effect involving these two issues, the Atlas powerfully tells the story of climate change and its impacts through paired satellite images. Vignettes from people’s lives provide personal accounts, describing how environmental change has affected them, how they have adapted to it, and also helped to slow further deterioration or restore environmental quality.

The Africa: Atlas of Our Changing Environment is an immense resource for all who have an interest in the regional environment. It among others:

• Introduces Africa in the global context, providing a general description of the region’s geography, plants and animals, and its people. Highlights transboundary environmental change across national borders and frontiers, highlighting the effects of such change on people and the environment itself. It emphasizes the need for international cooperation to manage shared water bodies, ecosystems, and protected areas; cross-border pollution; and environmental issues related to conflict.

• Spotlights briefly each country in Africa, describing how each is faring in terms of achieving the targets set under Goal 7 of the United Nations’ Millennium Development Goals (MDGs): “Ensure Environmental Sustainability”. The incorporation of the MDG Goal 7 targets, and observations on the progress African countries have made towards achieving them, is yet another unique feature of this Atlas.

• Summarizes the magnitude of the challenges that Africa faces that will become even more taxing in light of climate change and its potential impacts on Africa and its people. The Atlas also examines geographic and ecological issues of relevance at the national level. It presents each country’s unique features, and highlights some of the major environmental trends and challenges of each. It displays paired satellite images, focusing on specific sites in each African nation where environmental change is visually evident. Each “change pair” of images is accompanied by a short write-up, drawing on scientific literature. The result is a concise, accessible presentation of a case study of environmental change.

It is important to note that different sites highlighted in this Atlas are only a window through which we can understand that environmental change is a widespread phenomenon throughout Africa.

The Africa: Atlas of Our Changing Environment brings compelling visual and scientific evidence of environmental change derived from the Earth observation sciences to a broader audience; builds awareness about our rapidly changing environment; and will help us make better decisions together to ensure our mutual future on this ever-more crowded globe—our planet Earth.

It is the work of many partners of UNEP. I would like to express the gratitude of the United Nations to our partners in Africa as well as the United States government whose support through agencies not only made the satellite data and analyses available, but also is committed to building capacity in Africa to strengthen efforts to analyse environmental change and inform effective policy responses.
“I reflect on my childhood experience when I would visit a stream next to our home to fetch water for my mother. I would drink water straight from the stream. Playing among the arrowroot leaves I tried in vain to pick up the strands of frogs’ eggs, believing they were beads. But every time I put my little fingers under them they would break. Later, I saw thousands of tadpoles: black, energetic and wriggling through the clear water against the background of the brown earth. This is the world I inherited from my parents. Today, over 50 years later, the stream has dried up, women walk long distances for water, which is not always clean, and children will never know what they have lost. The challenge is to restore the home of the tadpoles and give back to our children a world of beauty and wonder.”

Excerpt from Nobel Peace Prize Acceptance Speech By Wangari Maathai
10 December 2004

Africa: Atlas of Our Changing Environment is the first publication to use satellite photos to depict environmental change in each and every African country during the last thirty years. Through a rich array of satellite images, graphs, maps, and photographs, this Atlas presents a powerful testament to the adverse changes taking place on the African landscape as a result of intensified natural and human impacts. The remarkable developments in earth observation technology and its application during the last three decades have provided important tools for environmental monitoring. Earth-observing sensor systems on aircraft and spacecraft provide data streams for analysing environmental issues at varying spatial and temporal scales. The power of earth observations technologies to produce thousands of current and historical satellite images has illuminated the stories of environmental change, and has made this publication possible.

Africa: An Introduction to the Continent

There are 53 countries and one “non-self governing territory” (Western Sahara) in Africa. Ecologically, Africa is home to eight major biomes—large and distinct biotic communities with characteristic assemblages of flora and fauna. Chapter One of the Atlas vividly illustrates Africa’s geographical attributes, presenting a physical setting in which readers may visualize the changes human actions are etching on the landscape. Maps, images and informative text reveal that Africa is endowed with rich natural resources that provide the basis for its peoples’ livelihoods. Among the varied environmental features readers can see are rain forests, wetlands, mangroves, coral reefs, and coastal deltas. These ecosystems provide a rich and diverse array of potential sources of food and materials. In addition, Africa holds approximately 30 per cent of the earth’s minerals including 40 per cent of the gold, 60 per cent of the cobalt and 90 per cent of its platinum. In recent years, oil production has been the main contributor towards Africa’s economic growth. There are also grazing and agricultural lands that can support farming economies, as evidenced by the 56.6 per cent of Africa’s labour force engaged in agriculture.

On the other hand, in many areas the environments from which most people in Africa must eke a living are harsh and the climate challenging. Africa is the world’s hottest continent with deserts and drylands covering some 60 per cent of the entire land surface. Only ten per cent of farm soils are prime agricultural land, and more than one-quarter of the land has moderate to low potential for sustainable agriculture. Rainfall variability is high, ranging from near 0 mm/ year in parts of the Sahara to 9 500 mm/ year near Mount Cameroon. Droughts and famine are ever present, and tens of millions of Africans have suffered the consequences every season. Droughts not only directly cause food
insecurity, triggering migration in some cases, but also negatively impact economic performance.

**Water**

Africa's water resources are continuously affected by persistent droughts and changes in land use. At the same time, a growing population is increasing the demand on already limited water supplies, particularly in areas which suffer from water shortages. Currently, it is estimated that over 300 million people in Africa face water scarcity conditions. About 75 per cent of the African population relies on groundwater as the major source of drinking water, particularly in northern and southern Africa. However, groundwater represents only about 15 per cent of the continent's total renewable water resources.

**Land**

Land in Africa is becoming increasingly degraded. Erosion and/or chemical and physical damage has degraded about 65 per cent of agricultural lands. This has forced farmers in many places to either cultivate marginal and unproductive soils, further degrading the land, or to migrate to cities and slums. Some areas in Africa are said to be losing over 50 metric tonnes of soil per hectare per year. Thirty-one per cent of the region’s pasture lands and 19 per cent of its forests and woodlands are also classified as degraded. Forests account for over 20 per cent of Africa's 30 million km² of land area, but are being destroyed and degraded by logging and conversion to plantations, agriculture, roads, and settlements. As a region, Africa is losing more than four million hectares of forest every year—twice the world's average deforestation rate.

**Biodiversity**

Africa's rich biological diversity—one of the region’s most stunning attributes—is in jeopardy due to a confluence of habitat destruction, poaching, and increasing populations. Africa contains over 3 000 protected areas including 198 Marine Protected Areas, 50 Biosphere Reserves, and 80 Wetlands of International Importance. Eight of the world’s 34 international biodiversity hotspots are in Africa. Despite their recognized status, these areas remain under threat by civil unrest and encroachment, as well as the introduction of alien species. Resolution of such predicaments has been undermined by administrative problems including lack of funding and inadequate staffing or training.

**Changing Conditions**

The Atlas paints a vivid picture of the rapid, and in some cases dramatic, transformations taking place on the lands and waters that sustain Africa’s people. These include land degradation and desertification, water stress, declining biodiversity, deforestation, increasing dust storms, rising pollution and rapid urbanisation.

Moreover, climate change is likely to intensify these conditions and alter the environment even further. Although Africa emits only four per cent of total global carbon dioxide emissions, its inhabitants are projected to suffer disproportionately from the consequences of global climate change. Given its economic constraints, Africa's capacity to adapt to climate change is relatively low rendering the region exceptionally vulnerable to potential impacts. In many areas, even small changes in precipitation and water availability could have a devastating effect on agricultural output and therefore on food security. As climate change intensifies and its impacts deepen, adaptation will become increasingly difficult. Correspondingly, achieving targets set by the United Nations Millennium Development Goals (MDGs) will become more challenging.

**Transboundary Environmental Issues**

Chapter Two of the Atlas presents examples of transboundary environmental issues related to shared lands and waters, migrating animals and people, and pollutants that drift over borders of neighbouring countries. It highlights both emerging challenges and success stories in addressing these issues.

Africa has a number of large transboundary ecosystems—areas of land or sea that straddle one or more political boundaries. Some of these are officially protected areas which are extremely important for safeguarding Africa's remarkable animal populations and their habitats, truly one of the wonders of the
world. The importance of transboundary protected areas is especially obvious for migratory species, for example the Great Limpopo Transfrontier Park which connects South Africa’s Kruger National Park, Mozambique’s Limpopo National Park and Zimbabwe’s Gonarezhou National Park; and the Al-Aig Richtersveld Transfrontier Park along the cost of South Africa and Namibia. Africa also has 59 international transboundary river basins, which cover about 64 per cent of the region’s land area, contain 93 per cent of its total surface water, and are home to 77 per cent of the population. Multinational approaches are essential to conserving these shared areas, underscoring the need for cooperative management strategies among bordering countries.

Another transboundary issue of particular significance is the movement of air pollutants. Africa experiences the most extensive biomass burning in the world. Gaseous molecules emitted as a by-product of biomass burning can travel across national boundaries far from their original source. Fires contribute as much as 35 per cent to ground level ozone formation in Africa, bringing negative health consequences such as respiratory illnesses. The deserts contribute to dust storms that can drift over large areas.

Finally, political and economic difficulties give rise to refugee migrations, causing further pressure on the environment. Impacts resulting from masses of moving people affected by wars, conflicts, food and water shortages, and economic strife in one country may all extend into neighbouring countries. The Atlas displays a map of major refugee settlements scattered across the region, and images of their effects upon an already-stressed environment.

Tracking Progress Towards Environmental Sustainability

Chapter Three is the star attraction of this Atlas. It contains brief profiles of every African country, their important environmental issues, and a description of how each is faring in terms of progress towards the targets under the UN’s Millennium Development Goal 7: ensure environmental sustainability. “Before and after” satellite images from every country highlight specific places where change is particularly evident.

This chapter also provides measures of progress towards the Millennium Development Goals’ (MDG) environmental targets. The Atlas depicts whether or not each country has increased the percentage of its land area covered by forest, increased the land area covered by designated protected areas, decreased carbon emissions, improved access to clean water and sanitation, and reduced the slum population as a percent of urban population.

Between 1990 and 2004, a large number of countries witnessed real improvements in their efforts towards achieving the MDG targets that measure environmental progress. In many other cases, the improvements have been incremental, but promising (Figure 1). Most countries focused on improving those elements of the environment with direct relevance to human health (e.g., sanitation and water). Over 30 countries improved access to safe water and sanitation, and 23 countries reduced the percentage of people living in slums. A few countries have expanded protected areas. The most evident failure in progress towards the MDGs is in the loss of forest cover.

A comprehensive review was conducted using public information and peer-reviewed reports to identify the salient environmental issues each country faces, producing a unique environmental portrait of every African nation (see Table 1, page xiv-v). The review indicates that deforestation is a main concern in 35 countries, land degradation is a key issue in 32 countries, and threats to biodiversity is a major issue in 34 countries. Overfishing and coastal degradation affect some 23 countries (Figure 2). Desertification, water scarcity, and air and water pollution are also critical issues. Many of the countries’ separate issues of concern are interrelated, e.g., desertification and land degradation; and deforestation and threats to biodiversity. Although ‘climate change’ is not listed as an important issue, it is a possible driving force behind the problems noted.

Africa Then and Now: Images of a Changing Environment

The display of satellite images in Chapter Three provides scientific evidence of some of the scars that human activity and natural processes have left on the African landscape. These include but are not limited to: gouges made by mining operations; pock marks from bore holes; bald patches where forests once stood; and lakes that have completely disappeared. There are also images that reveal more diffuse, but nonetheless troublesome, change such as the swell of greycoloured cities over a once-green countryside; threats to biodiversity by conversion of nature habitats; the tracks of road networks through forests; the erosion of deltas; and shrinking mountain glaciers.

Despite the numerous challenges, people across Africa are taking significant steps towards protecting and improving their environment. A number of images show the positive results of some of the many efforts undertaken to not only stem environmental destruction, but to reverse it. Success stories include land revitalisation evident by the growth of tree clusters in certain images of Niger, and in one instance, the expansion of wetlands resulting from a restoration project to control flooding in Mauritania.

In addition to well-publicised changes, such as Mount Kilimanjaro’s melting glaciers, the shrinking of Lake Chad, and falling water levels in Lake Victoria, photographic evidence of a large number of new environmental hotspots is presented here for the first time. The following ten sites are examples selected from 104 such sites in this Atlas:
The pressures of a dramatically growing population are illustrated in changing land use surrounding “W” National Park since the early 1970s. In contrast, the land cover within this protected savannah woodland in southeastern Burkina Faso remains relatively unchanged. The country’s most pristine protected area is an important elephant habitat.

The widening of corridors of deforestation surrounding local roads in the northern area of the Democratic Republic of the Congo since 1975 is depicted with two striking images. New roads for commercial logging and a proposed road improvement project threaten to bring even greater traffic to this biologically diverse rain forest.

The impact of a population explosion on farmland and forest is clearly seen in contrasting images of the Maradi District in Niger. A large area of savannah woodland was converted to agriculture between 1976 and 2007. In addition, the lack of fallow land among farms in 2007 reveals the intensity of farming in this district.

In the past half-century or so, the population of Senegal has soared, with much of the growth occurring in its urban areas. The dramatic expansion in the capital, Dakar, between 1942 and 2007 is shown via aerial photography from the 1940s and a recent high-resolution satellite image. Originally occupying a small centre of urban development at the tip of the Cap Vert Peninsula, the Dakar metropolitan area has grown to a population of nearly 2.5 million people spread over the entire area.

A large portion of southwestern Madagascar’s South Malagasy spiny forest has evidently disappeared between 1973 and 2003. Farming, and to a lesser extent, fuelwood gathering, have taken a large bite out of this biodiversity hotspot which is home to several endemic species.

Protection from grazing in the Sidi Toui National Park in southeastern Tunisia produced a dramatic rebound in the natural ecosystem. Satellite images from 1987 and 2006 show the revival of grasses and scrub inside the park’s boundaries, which appear like puzzle pieces dropped onto the otherwise degraded landscape. The Scimitar-horned oryx (*Oryx dammah*), now near extinction, was reintroduced to the park in 1999.

Greenhouses can be seen replacing desert-fighting trees in images that show the striking transformation of the Souss-Massa Valley in Morocco since 1988. The greenhouses use scarce water resources more efficiently than unprotected agriculture. However, the loss of many of the Argan trees in the valley due to agricultural practices and a depleted water table, has removed one of nature’s ways of combating desertification.

A new management plan for the Itezhi-tezhi Dam in Zambia has helped to restore the natural seasonal flooding of the Kafue Flats. A satellite image from early 2007 captures the height of the first flood season where water was released from the dam to assist natural flooding.

The remarkable appearance of a chain of lakes in the deserts of Egypt is captured in a series of satellite images beginning in the late 1980s. A massive volume of water was released through Lake Nasser’s spillway to prevent flooding damage along the Nile Valley. The New Valley Project will...

</table>
air give you protein? Can air give you carbohydrates?” he asked. “It would be easy to convince people to stop clearing the forest if there was an alternative” (Quoted from the chicagotribune.com—Rain Forests Fall at ‘Alarming’ Rate—By Edward Harris, Associated Press Writer February 3, 2008).

As for the people whose footprints we see so strikingly stamped on the pages, to some degree their ability to choose plays a role in the choices ultimately made. As Nelson Mandela, Nobel Laureate and Former President of the Republic of South Africa, tersely put it, “... For me, survival is the ability to cope with difficulties, with circumstances, and to overcome them.”

Alleviation of poverty is a key step towards establishing an environment in which people are empowered to make sustainable choices. The economy of Africa can be expanded beyond its agricultural base to increased investment in the services and manufacturing sectors. Development for both local consumption and exports, balanced with environmental preservation, can bring Africa to a position where its wealth of natural resources is more accurately reflected in the economic status of its peoples. Coupled with education and training, and empowerment of women, a broadened economy in Africa would enhance local employment prospects as well as economic opportunities to trade in world markets.

Many factors, such as governmental policies, cultural and social milieu, play a role in whether we will achieve global environmental sustainability. But as is the case in environmental systems, all the pieces are interconnected. Once people are secure enough to choose, one can, if wise, opt for the land and resource-use alternatives that are sustainable and regenerative. In the absence of such opportunities, it is likely that people will continue to make expedient choices for their survival, which, voluntarily or involuntarily, can result in environmental degradation.
A View of Earth from Space

Seen through the rings of Saturn, Earth appears as little more than a shining dot in this satellite composite image taken by the Cassini spacecraft in 2006. At this distance, the nature of Earth is obscure. A closer view, however, reveals that our planet is unique in the solar system, home to seven major continents scattered across a network of oceans. Each of these continents, too, is unique. The second largest—Africa—spans the equator and stretches from northern temperate to southern temperate zones. Understanding Africa requires an understanding of its vastly diverse ecosystems, as well as the many challenges its people face both today and tomorrow.
A new bride, Ethiopia
